

# College Complaint System using Python

Final Year Project — Application Development  
(Web System)

PLATFORM: PYTHON . MYSQL

SCOPE: SINGLE COLLEGE-DEPLOYMENT

| Sr no. | Name                   | Enrollment No. | Email                           |
|--------|------------------------|----------------|---------------------------------|
| 1      | Aditya Salunke         | 2401201161     | adityasalunke2301@gmail.com     |
| 2      | Tirthrajsinh Vansadiya | 2401201198     | vansadiyatirthrajsinh@gmail.com |

Project Mentor : Ms. Kajal Barot

# OUTLINE

- Abstract
- Introduction
- Literature Review
- Problem Statement
- Proposed System (Tools & Technology)
- Expected Outcome
- Conclusion
- References

# Abstract

- Digital system to log, track and manage campus complaints
- Purpose: replace manual registers with an auditable web app
- Key features: complaint submission, admin dashboard, status updates (Pending / In Progress / Resolved)
- Benefits: reduced paperwork, accountability, faster resolution

# Introduction

- Manual complaint processes: paper forms, physical registers, phone calls
- Delays and lost records reduce responsiveness and trust
- Need for centralized, accessible, and traceable complaint handling
- Target users: students, faculty, maintenance staff, administration

# Literature Review

| Sr. No | Existing System                 | Description                                             | Advantages                                                        | Limitations                                                          |
|--------|---------------------------------|---------------------------------------------------------|-------------------------------------------------------------------|----------------------------------------------------------------------|
| 1      | Paper-based Complaint System    | Complaints are written on paper and submitted to office | Simple and low cost                                               | Difficult to track complaints, chances of data loss, no transparency |
| 2      | Email-based Complaint System    | Students send complaints through email                  | Easy to send complaint                                            | No proper tracking system, difficult to manage many emails           |
| 3      | Generic Online Ticketing System | Online complaint systems used in companies              | Complaint tracking and status update available                    | Not customized for college needs, complex to use                     |
| 4      | Campus ERP Portal               | Some universities use ERP portals for complaints        | Centralized system                                                | Costly and not suitable for small colleges                           |
| 5      | Proposed System (Our System)    | College Complaint Management System                     | Role-based login, complaint tracking, data storage, user-friendly | Requires internet and basic technical knowledge                      |

# Problem Statement

- Loss of complaint records and manual tracking errors
- Poor visibility of status for complainants and administrators
- Inefficient allocation and follow-up of maintenance tasks
- Lack of metrics to measure resolution time and recurring issues

# Proposed System (Tools & Technology)

- Backend: Python (Flask/Django) — lightweight, maintainable
- Database: MySQL — relational storage for complaints, users, logs
- Frontend: responsive HTML/CSS + minimal JS for forms and dashboards
- Workflow: Submit → Triage → Assign → Update Status → Close
- Security: role-based access, input validation, secure DB connections

# Expected Outcome

- Improved transparency: real-time status visible to stakeholders
- Faster resolution: streamlined assignment and notifications
- Data for decisions: track common issues and service-level metrics
- Reduced paperwork and administrative overhead
- Scalable for other college departments with minor configuration

# Conclusion

- College Complaint System addresses key operational gaps
- Delivers accountability, measurable outcomes, and user convenience
- Feasible implementation using Python and MySQL within college constraints
- Future extensions: mobile app, analytics dashboard, multi-college support
